This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

A NEW TABLE

OF

SEVEN-PLACE LOGARITHMS

OF ALL NUMBERS FROM 20 000 TO 200 000

BY

EDWARD SANG, F.R.S.E.

SECRETARY OF THE ROYAL SCOTTISH SOCIETY OF ARTS; MEMBER OF THE FACULTY OF ACTUARIES IN SCOTLAND; FORMERLY PROFESSOR OF MECHANICAL SCIENCE IN THE IMPERIAL SCHOOL, MUHENDIS-HANA BERII, AT CONSTANTINOPLE

PREPARED UNDER THE AUSPICES OF THE MANAGERS OF THE ASSOCIATED LIFE INSURANCE OFFICES IN SCOTLAND

LONDON
CHARLES AND EDWIN LAYTON

ELECTROTYPED AND PRINTED BY

WILLIAM BLACKWOOD AND SONS, EDINBURGH

PREFACE.

So many tables of seven-place Logarithms have already been published, that, while offering a new one to computers, it is proper to explain clearly wherein the novelty consists, and what advantages are to be derived therefrom.

JOHN NEPAIR, in the Appendix to his Constructio published posthumously at Edinburgh by Andrew Hart, in 1619, edited by Robert Nepair, and accompanied by Lucubrations by Henry Briggs, says, "Of all Logarithmic systems, that one is the most convenient which has zero for the Logarithm of unit, and unit for the Logarithm of ten"—"Inter varios Logarithmorum progressus is est præstantior, qui cyphram pro Logarithmo unitatis statuit et 10,000,000,000 pro Logarithmo denarii seu decupli instituit."

The convenience of this system is, that the fractional part of the Logarithm depends on the digits of the number, while the integer part is regulated by the position of the highest digit upon the numeration scale. Hence a table of the denary Logarithms of all numbers from, say, 10 000 to 100 000, may be made to serve for all numbers whatever. Such are the seven-place Logarithmic tables in common use.

The table of denary Logarithms was first computed by HENRY BRIGGS, Savilian Professor of Geometry at Oxford, according to one of the methods explained in Nepair's Appendix, for all numbers from 1 to 20 000, and from 90 000 to 100 000; and was published to fourteen decimal places, at London, in 1624.

The blank left by Briggs was filled up by ADRIAN VLACQ, of Gouda, who published in 1628 a table of ten-place Logarithms

for all numbers up to 100 000. All the seven-place tables since published seem to have been taken from Vlacq's great work.

In his Trigonometria Britannica, published at London in 1658, JOHN NEWTON introduced the arrangement of placing the first three figures of the Logarithms at the side of the page, and the remaining four figures in ten vertical columns. The clearness and conciseness of this arrangement have secured its universal adoption.

This short account contains the whole essential history of seven-place Logarithmic tables up to the present time.

At the beginning of the seven-place table, the differences are large and numerous, the side tables of proportional parts are crammed into the page, and hence the interpolations can be performed mentally only by experienced computers. As we advance in the table, the differences become smaller and fewer, so that the interpolation is easily managed: the object of the present table is to secure this facility all along.

According to Nepair's idea, a Logarithmic table, in order to be complete, must extend from some number to its decuple; from 10 000 to 100 000 as in the usual tables; from 20 000 to 200 000 as in this new table.

By placing the beginning at 20 000 instead of at 10 000, the differences are halved in magnitude, while the number of them in a page is quartered, so that the labour of the interpolation is very much lessened, and great additional facility is afforded to the computer.

In order to carry out this idea, it was requisite to calculate the Logarithms of the hundred thousand numbers from 100 000 to 200 000, which form the new part of the table. For this purpose the whole calculation has been made from the beginning, as if Logarithms had never before been computed; and each step of the calculation has been recorded for reference in case of suspected error. For prime numbers up to 2027 continuously, and for many other primes happening incidentally in the calculation, the Logarithms were carried to 28 places, with the view to certainty in the 25th place; each being verified by an independent check.

The Logarithms, to 15 places, of the products of these primes were inscribed in a ruled form, and the gaps above 100 000 were filled up by interpolation with second differences. Finally, the last two figures only of the second differences were written in their places on other blank forms and the table computed by continuous summation all the way from 100 000 to 200 000. In this way the manuscript exhibits, to 15 places, the Logarithms of all these numbers with their first and second differences, and with scarce the probability of a single error throughout, except, indeed, the unavoidable minute errors in the fifteenth place. The types were set from this manuscript.

Thus the amount of work done in preparing the new part of this table has been greater than the labours of Briggs and Vlacq conjoined, even although the facilities afforded by modern methods be taken into account.

This extension of the table to twice the usual limit forms the essential feature of the present work; at the same time some minor matters of detail have been attended to. While editing Shortrede's Logarithmic Tables, I received a page without the usual rules because the printer's stock of them had been exhausted. The superiority of the white spaces was so manifest that I at once adopted them in the subsequent table of Antilogarithms printed in that work. The same plan is followed here, and the only line used is a thin one to separate the difference tables from the body of the page.

Many trials and long experience have shown that the legibility of a mass of figures depends much more upon the separation of the figures from each other than upon their shapes; and the eminent firm of Miller and Richard, type-founders, have supplied a fount of types in which the figures are kept much more apart than is usual. The result has been a page of tabular matter which does not strain the eye, and which will compare favourably in point of legibility with any other type.

M. V. Bagay, in his Tables Hydrographiques, Paris, 1829, adopted a distinct mark ⊙ to indicate a change in the leading figures. This idea was followed up in Shortrede's Tables, an

enlarged Arab nokta ♦ being substituted for the European nulla, and repeated along the line. This method of indicating the change is followed in the present work. Farther, at the suggestion of Mr William Thomas Thomson, Manager of the Standard Life Assurance Company, the first three figures of the logarithm are placed below the last line of the page whenever a change occurs there.

The sparseness of the difference tables has allowed the multiples of the differences to be substituted for their proportional parts, so as to give greater probability of accuracy to the last figure obtained by interpolation.

Every care has been taken to obtain accuracy in the printed tables. The pages have been electrotyped to prevent the possibility of change during the process of printing; and a spare set of electrotyped plates has been made to be preserved for the sole purpose of reproducing future working plates. It would be too much to hope that such an extensive table does not contain a single error, yet that exactitude has been steadily aimed at during the whole progress of the work. Computers are therefore earnestly requested to notify to the Publisher any fault which they may discover, along with their own name and address, in order that the error may be made public and corrected in the plates. As the reserved plates also will be corrected, the work will become more and more trustworthy with the lapse of time.

2 George Street, Edinburgh,
November 1870.

DESCRIPTION OF THE TABLE.

An account of the nature and construction of logarithmic tables belongs properly to a treatise on Algebra, and would be out of place here, because it would encumber the book with matter to which the computer never refers. A description of the actual table, and an account of the mode of using it, are all that can be tolerated in this place. For my own part, in causing copies of Hutton's tables to be bound for daily use, I have been accustomed to remove everything but the tabular matter.

The first part of this table, occupying five pages, contains the fractional parts or *mantissæ* of the logarithms of all numbers from 1 to 1000; these are printed to ten decimal places, the last three being separated by a thin space. These logarithms are useful in certain special cases. When seven places only are needed, the additional figures can be left off if they be less than 500; but, whenever they exceed 500, the seventh figure must be augmented by unit in order that the residual error may be as small as possible; thus, shortening from ten to seven places,

Log 37,6 = 1,575 1878
Log 37,7 = 1,576 3414

The second part of the table, occupying 360 pages, contains the fractional parts of the logarithms of all numbers from 20 000 to 200 000, arranged according to John Newton's plan. The numbers, all but the last figure, are placed in the left-hand or first column of the page, and the last figure is to be found in the top or bottom line. Of the mantissæ, again, the first three figures are printed at intervals in the second column, and are preceded by the decimal point (,); the remaining four figures of the mantissæ are placed in ten vertical columns separated by white spaces, the fifth space being, for the sake of clearness, broader than the others. These columns belong to the final figures placed at the top and bottom.

For example, if we desire the logarithm of the number 237,68, we first of all observe that, since this number exceeds the second power of *ten*, its logarithm must exceed 2, or that the integer part, often called the *index* of the logarithm, is 2. Then looking for 2376 in the first column, we pass along the horizontal line until under the final figure 8; there we find 9926, which has to be read with the antecedent ,375 found in the second column, so that the whole logarithm of 237,68 is 2,375 9926.

If, however, the number 237,69 had been proposed, we should have found the last four figures of the mantissa to be ♦109. Here the mark ♦, called the change

mark, is placed instead of 0, and serves to show that the antecedent figures must be changed from ,375 to ,376; the logarithm of 237,69 is thus 2,376 0109.

The figures ,375 are held to be written before every group of four figures from ♦048 to 9926; and ,376 are held as preceding each group from ♦109 to 9965, after which ,377 begins. The change mark is repeated along the line so long as the fourth figure of the mantissa is 0, in order to attract attention, as is seen in the lines 2382, 2208; but the change continues beyond these marks: thus the logarithm of 2094,7 is 3,321 1218. When the change happens at the foot of a page, the next antecedent figures are printed below the last line, as at 2249.

The difference tables are placed on the right-hand margin of the page, and are separated by a thin line. These tables contain the differences and their multiples by each of the digits 2, 3, 4, 5, 6, 7, 8, 9; they are useful for interpolation.

For want of room, three of the difference tables near the beginning of the book have been left out; these are for the differences 210, 200, and 190. It is, however, quite easy to supply them by merely substituting 0 for the last digits in the tables 211, 201, 191. The omission was made in order to avoid the turning of the leaf: thus the difference 207 is found both at the bottom of page 7 and at the top of page 8; the omission of the table for 210 causes less inconvenience than would have resulted from the having to turn the page.

The possession of a table of logarithms enables us to solve two problems; the one, "To find the logarithm of a given number,"—the other, "To find the number corresponding to a given logarithm."

When the given number or the given logarithm is found exactly in the table, the corresponding logarithm or number is obtained by simple inspection; but when otherwise, we have to interpolate. The principle of this interpolation is, that for any difference between two logarithms given in the table, the change in the number may be held to be proportional to the corresponding change in the logarithm. This proportionality is not strictly true, but any error arising from it is far too minute to have any perceptible influence on the seventh decimal place; indeed we must push our logarithms to the tenth decimal place before any error of this kind becomes perceptible.

Let it be proposed to find the logarithm of the number 365,242 217, which expresses the length of the equinoctial year measured in mean solar days.

The logarithm of 365,24 is 2,562 5783, which is too small, while that of 365,25 is 2,562 5902, which is too great; the logarithm which we are seeking is between these. Now their difference is 119, hence we have the proportion 10000 : 2217 : : 119 : 26; wherefore, adding this correction to the first logarithm, we obtain 2,562 5809 for the logarithm of 365,242 217.

By help of the difference tables the interpolation may readily be performed as follows:—

Log	365,24	=	2,562 5783	
Correction for	2		23	8
	2		2	38
	1			119
	7			83
Log	365,242 217	=	2,562 5809	

Practised computers find it more convenient to make this little calculation

mentally. Here it is obvious that the last two figures 17 have had no perceptible effect on the seven-place logarithm.

If the first additional figure of the proposed number be 0, we must be careful to cut off two figures from the difference-multiple; thus, for the logarithm of 263,67075 we have—

Log	263,67	=	2,421 0607	
Correction for	07		11	55
	5			825
Log	263,67075	=	2,421 0619	

Sometimes we find it more convenient to count backwards; thus, in seeking the logarithm of the well-known number π = 3,141 5926, we prefer to regard it as 3,1416—074 and proceed thus:—

Log	3,1416	=	0,497 1509	
–	07		– 9	66
	4			552
Log	3,1415926	=	0,497 1499	

Conversely we can find the number corresponding to any proposed logarithm. A single example may serve to explain the process. Thus, let it be proposed to find that number whose logarithm is 0,434 2945, the modulus of denary logarithms. The tabulated logarithm immediately less than this is ,434 2814, which belongs to the number 2,7182, the error is 131, and the tabular difference is 160: hence we have the proportion 160 : 131 : : 100 : 82, so that the required number is 2,718282. Using the difference tables this operation is performed as under:—

2,7182	,434 2945
	2814
	1310
8	1280
2	300
2,718282	

This interpolation is always to be performed mentally; and it may be observed that this, the inverse use of the table, is more convenient than the direct process.

These two problems—To find a logarithm from its number, and To find a number from its logarithm—are the only ones which such a table enables us to solve: all other logarithmic processes are founded on the possibility of performing these two operations.

When using the table, the operator should place the book at his left hand, the paper on which he is to write at his right hand, and this paper should be secured in some way from moving, as by a weight, in order that the left hand may be free to turn the pages. On no account should the pen or pencil be brought in contact with the tables. Each page contains 500 logarithms, so that the logarithms of one thousand numbers are presented at each opening of the book; and thus the last three digits of the number determine the position occupied by its logarithm. Thus the logarithms of all numbers ending in 738, from 20738 to 199738, are to be looked for on the right-hand page, in the line 73 near its outer end; if, then, we be looking for the logarithm of 78 738, we make up our

mind as to the place on the page while we are turning over the leaves for the antecedent figures 78. This apparently trifling matter conduces greatly to the comfort of the operator. In writing the logarithms it is expedient to make a slight separation at the third figure of the mantissa.

The logarithm of every numerical expression less than unit is subtractive: thus the logarithm of $\frac{3}{5}$ or ,6 is log 3 – log 5 = – 0,221 8487. Now it is very inconvenient to have subtractive and additive quantities mixed together; we prefer to make use of the arithmetical complements of the subtractive logarithms or their defects from 10; thus, instead of – 0,221 8487, we write + 9,778 1513, observing, however, that the result obtained by adding this latter is too great by 10 integers. This custom carries with it this other advantage, that the same mantissa belongs to the effective digits wherever these may be placed on the numeration scale; thus the logarithm of 79,813 is 1,902 0736, while that of ,079813 is written 8,902 0736.

A very little practice enables the computer to write the arithmetical complement of the logarithm, or the *cologarithm* as it is called, as quickly as the logarithm itself; thus colog 581,69 = 7,235 3084. Each digit has to be subtracted from 9, except the last digit, which must be taken from 10; only we must observe that, when the logarithm ends in 0, the last effective figure must be taken from 10; thus colog 5,2864 = 9,276 8400; or, again, colog 57,544 = 8,240 0000. Also, it must be observed that the cologarithm of a fraction of unit becomes again additive—thus colog ,0188237 = 1,725 2950; and that the result obtained by the addition of this cologarithm is no longer too great by 10.

COMPUTATION BY HELP OF LOGARITHMS.

In a work like the present it may be proper to exhibit those arrangements which are found to be most convenient in the management of logarithms. These were invented by Nepair for the express purpose of relieving astronomers from the enormous toil incident to the multiplications and divisions of trigonometrical calculations; hence the first table was purely trigonometric—and only after the "wonder-working Canon" was completed, did he perceive the facilities which logarithms would give in general calculation.

MULTIPLICATION.

When the product of two numbers having only a few effective digits is wanted, the ordinary process of multiplication is sufficiently concise; but when there are several factors, or when these have several effective figures, the logarithmic process is much to be preferred; it is to add together the logarithms of all the factors, and then to seek for the number of which this sum is the logarithm.

EXAMPLE.

Required the weight of a block of lead, 17,8353 inches long, 11,9281 broad, and 4,6836 thick; the specific gravity of lead being 11,325, and the weight of one cubic inch of water being ,0360654 parts of a pound avordupois.

Here the continued product of the three dimensions is the number of cubic inches in the bulk of the lead; that multiplied by the specific gravity gives the number of cubic inches of water which would weigh as much as the lead; lastly, the product of this by the weight of a single cubic inch of water gives the required weight. Hence the following scheme of operation:—

Log	17,8353	= 1,251 2804
Log	11,9281	= 1,076 5713
Log	4,6836	= 0,670 5798
Log	11,325	= 1,054 0382
Log	,0360654	= 8,557 0907
Log	406,9681	= 2,609 5604

In this example, one of the factors is less than unit, and instead of the subtractive logarithm – 1,442 9093 we have written + 8,557 0907; the amount would therefore be too great by 10, and so we have rejected 10 from that amount, and written 2,609 5604 instead of 12,609 5604. The number belonging to the sum of the logarithms is 406,9681, so that the weight of the lead is almost 407 pounds.

DIVISION.

The logarithm of a quotient is found by subtracting the logarithm of the divisor from that of the dividend. Hence, for example, the operation for dividing 279,437 by 128,264 is performed thus:—

Log 279,437	= 2,446 2839
Log 128,264	= 2,108 1048
Log 2,178 608	= 0,338 1791

If the divisor exceed the dividend, the quotient must necessarily be less than unit, and its logarithm must be subtractive; in such a case we augment, mentally, the logarithm of the dividend by 10, and so obtain a redundant index for the logarithm of the quotient; in this way we avoid the necessity for and the inconvenience of tables of subtractive logarithms. For example, the operation for dividing 51,83972 by 829,6077 is performed thus:—

Log 51,83972	= 1,714 6626
Log 829,6077	= 2,918 8728
Log ,0624 8701	= 8,795 7898

Again, when the divisor is less than unit, the quotient must exceed the dividend: thus, to divide 138,07317 by ,079 6321, we operate as follows:—

Log 138,07317	= 2,140 1093
Log ,0796321	= 8,901 0882
Log 1733,8884	= 3,239 0211

Instead, however, of subtracting the logarithm of the divisor, we often prefer to add its cologarithm, rejecting 10 from the amount; and this substitution is always made in the case of mixed multiplications and divisions.

Thus the three preceding computations might have been performed as below:—

Log 279,437	= 2,446 2839
Col 128,264	= 7,891 8952
Log 2,178608	= 0,338 1791
Log 51,83972	= 1,714 6626
Col 829,6077	= 7,081 1272
Log ,06248701	= 8,795 7898
Log 138,07317	= 2,140 1093
Col ,0796321	= 1,098 9118
Log 1733,8884	= 3,239 0211

and it is to be observed that in the second and third examples the rejection of 10 does not occur.

PROPORTION.

The fourth proportional to three given numbers is obtained by multiplying together the second and third terms, and then dividing the product by the first term; therefore, when logarithms are to be used, we add together the logarithms of the second and third terms, and then subtract the logarithm of the first term from the amount. For example, if the fourth term of the proportion 27,86957 : 73,86215 : : 1368,0731 : be required, we proceed thus:—

Log	73,86215	= 1,868 4220
Log	1368,0731	= 3,136 1093
		5,004 5313
Log	27,86957	= 1,445 1303
Log	3625,777	= 3,559 4010

It is far preferable, however, to use the cologarithm in the following manner:

Col	27,86957	= 8,554 8697
Log	73,86215	= 1,868 4220
Log	1368,0731	= 3,136 1093
Log	3625,777	= 3,559 4010

here the order of the terms is not changed.

The logarithmic process affords us great convenience in cases of distributive proportion. Thus, if a certain sum of money be to be collected from the proprietors in a parish, according to the extent of ground which each possesses, we have several proportions to work out, in all of which the antecedents are the same. Adding together the cologarithm of the entire acreage and the logarithm of the whole sum to be raised, we obtain the logarithm of the rate per acre. This added to the logarithms of the numbers of acres in the several properties gives the logarithms of the sums to be paid on account of each. Hence the following arrangement for distributing a charge of say £23787,4 among the proprietors of the subjoined acres:—

Name.	Acres.	Log. Acres.	Log. Charge.	Charge.
A	742,3	2,870 5795	3,031 6486	1075,594
B	2893,5	3,461 4235	3,622 4926	4192,689
C	1273,0	3,104 8284	3,265 8975	1844,580
D	3047,2	3,483 9010	3,644 9701	4415,400
E	438,1	2,641 5733	2,802 6424	634,808
F	73,8	1,868 0564	2,029 1255	106,936
G	4256,4	3,629 0424	3,790 1115	6167,533
H	3692,1	3,567 2735	3,728 3426	5349,862
Col.	16416,4	= 5,784 7221	Total,	23787,402
Log.	23787,4	= 4,376 3470	Excess,	,002
Log. rate per acre,		= 0,161 0691		

Here opposite to each name we have written the number of acres, the sum of which gives 16416,4 for the total surface of the parish; adding the cologarithm of this to the logarithm of the total charge we obtain the logarithm of the rate per acre. In the third column of the scheme we have placed the logarithms of the numbers of acres. Having written the rate-logarithm 0,161 0691 on the upper edge of a slip of paper, we bring it close to each term of column third, in succession, and, adding, write the sums in the fourth column, these are the logarithms of the charges; lastly, seeking the numbers corresponding to these logarithms, we obtain the charges to be made against the several proprietors. Finally, to make all sure, we take the total of these calculated charges, to see whether it agree with the prescribed total charge. The excess is only ,002, which upon £23000 is within the degree of precision attainable by the use of seven-place tables.

These instances may serve to show the general character of those arrangements which the computer has to make according to the nature of the work before him.

DEGREE OF EXACTITUDE.

It is now proper to examine the degree of precision attainable by the use of the table.

It is not pretended that the mantissæ entered in such tables indicate absolutely the logarithms of the corresponding numbers; they are merely the nearest representations of those logarithms obtainable with seven decimal places, and are sometimes in defect, sometimes in excess; but the defect or excess never exceeds one half of a unit in the seventh place,—that is, one twenty-millionth part of the logarithm of ten, which is the logarithm of 1,000000 115. That is to say, the greatest inaccuracy produced by the use of one of these mantissæ is about one nine-millionth part of the quantity under consideration.

If the result have to be obtained by interpolation, the range of the inaccuracy is widened, because there is the possibility of as great an error in the correction. It may happen that a defect in the tabulated quantity is balanced by an excess in the correction, but it may also happen that both are in excess or both in defect; hence the limit of the possible error now extends to unit in the last place. This inaccuracy is made worse when the proportional parts of the differences are used, because each one of these parts is liable to the same error. For this reason the multiples of the differences have, in this work, been substituted for the usual proportional parts.

If, then, we add together several logarithms which have been obtained by interpolation, the result is liable to an error of almost unit in the last place, for each logarithm employed, and the taking out of the corresponding number is liable to a similar error, so that the possible inaccuracy is magnified in proportion to the number of times the table is used. The case indeed must be very rare in which all the errors lie on one side, and still rarer that in which each error is nearly at its limit; yet still this may possibly happen, and therefore in estimating the limit beyond which our result cannot err, we must take this possibility into account.

Thus, in the example which has been given of multiplication by help of logarithms, the table has been used four times without and twice with interpolation;

wherefore the possible error in the result amounts to four half and two whole units—in all, to four units in the seventh decimal place; and all that we can say *absolutely* concerning the final conclusion is, that it cannot err by so much as eight nine-millionth parts of itself. Probably its error is far within that limit.

INVOLUTION.

Ordinary involution is merely the continued multiplication of equal factors; hence the logarithm of the seventh power of a number is just seven times the logarithm of that number. Hence the operation for finding the fifth power of 13,07218 is this—

Log	13,07218	= 1,1163480
		× 5,
Log	381715,7	= 5,581 7400

Here we must observe that the error of the logarithm, whether in excess or in defect, is magnified five times: it is the case of a product in which all the errors lie on one side; wherefore the relative inaccuracy in high powers becomes greater in proportion to the index. Hence the expediency of taking the logarithm of the root from tables of more decimal places.

When the quantity involved is less than unit we use the redundant index; thus, if the sixth power of ,87135 were required, we proceed as under—

Log	,87135	= 9,940 1926
		× 6,
Log	,437679	= 9,641 1556

Here the index is redundant by 10, wherefore the product is too great by 60; that product, however, is only 59,641 1556, wherefore, after rejecting the 50, the remaining index is still redundant.

INVERSE POWERS.

In order to find the logarithm of an inverse power, we may either take the arithmetical complement of the logarithm of the direct power, or the multiple of the cologarithm of the root. The latter process is, in general, the more concise.

Thus, to obtain the value of $17,8394^{-3}$ we may proceed as under—

	Log 17,8394	= 1,251 3802
		× 3
		3,754 1406
	Log ,0001761406	= 6,245 8594
or better thus—		
	Col 17,8394	= 8,748 6198
		× 3
	Log ,0001761406	= 6,245 8594

COMPOUND INTEREST AND DISCOUNT.

When the *interest* of money is at the rate of say 3 per cent, £1 to-day becomes £1,03 one year hence; two years hence it will become $1{,}03^2$, and so on; hence the amount of any sum of money after a given number of years is to be found by multiplying that sum by the proper power of the rate of improvement, 1,03, or whatever else it may be.

But when money is *discounted* at the rate of 3 per cent per annum, the rate of improvement is higher, since £97 to-day becomes £100 one year hence; the rate of improvement is in this case $,97^{-1}$.

Example 1. Interest being at the rate of 4 per cent, £3827 were lent in 1830: required the amount now in 1871—that is, after 41 years.

Log	1,04	= ,017 0333 393
		× 41
		,017 0333 393
		,681 3335 72
Log	$1{,}04^{41}$	= ,698 3669
Log	3827	= 3,582 8585
Log	19108,45	= 4,281 2254

Here the logarithm of 1,04 has been taken from the ten-place table in order to have its 41st multiple true to the nearest seventh place.

Example 2. The Bank agrees to allow interest at the rate of 3½ per cent per annum; what must be deposited now, 1871, to meet a payment of £17850 due in 1900—that is, 29 years hence?

Here we need the logarithm of 1,035 to more than seven places; but these digits are not found in the prefixed ten-place tables; we therefore resolve 1035 into factors as 5.207 or 15.69 and so find its logarithm.

Col	1,035	= 9,985 0596 502
		× 29
		9,865 5368 518
		9,701 1930 04
Log	$1{,}035^{-29}$	= 9,566 7299
Log	17850,	= 4,251 6382
Log	6582,15	3,818 3681

Example 3. When discount is at 3½ per cent per annum for bills with security, what is the value now in 1871 for a bill for £17850 payable in 1900?

A bill for £100 at one year would bring now 96,5, so that the rate of improvement is as ,965 : 1000; the logarithm of 965 to ten places might have been obtained from those of 193 and 5.

Log ,965	=	9,984 5273 133
	× 29	
		9,860 7458 197
		9,690 5462 66
Log $,965^{29}$	=	9,551 2921
Log 17850,	=	4,251 6382
Log 6352,29	=	3,802 9303

Example 4. Discount being at 4 per cent per annum for secured bills, to what sum will £3827 laid out in the purchase of these amount in 41 years?

Col ,96	=	0,017 7287 670
	× 41	
		0,017 7287 670
		0,709 1506 8
Log $,96^{-41}$	=	0,726 8794
Log 3827,	=	3,582 8585
Log 20405,06	=	4,309 7379

EVOLUTION.

The operation for the extraction of a root is the inverse of that for raising to a power; it is only when the root of a quantity less than unit has to be extracted that there is any peculiarity to notice.

Let the seventh root of 1632,47 be required.

Log 1632,47	=	3,212 8452 ÷ 7
Log 2,877252	=	0,458 9779

If the sixth root of ,00179614 were required, we must be careful in managing the redundant index. Thus 7,254 3402 is too great—that is, too much additive, by 10; if we were to divide this by 6, the quotient would no longer be too much by 10; wherefore we augment the logarithm as above by 50 more, so as to make it 60 too much, and then the quotient being 10 too much, belongs to the scheme of redundant logarithms.

Log ,0017 9614	=	57,254 3402 ÷ 6
Log ,3486 502	=	9,542 3900

FRACTIONAL POWERS.

Required the value of the expression $23^{\frac{4}{7}}$.

Log 23	=	1,361 7278
	× 4	
	7 |	5,446 9112
Log 5,99971	=	0,778 1302

Required the value of $97^{-\frac{5}{9}}$.

Col 97		= 8,013 2283
		× 5
	9	80,066 1415
Log ,0787477		= 8,896 2379

In this example the product 40,0661415 is too much by 50, wherefore if we add 40 to it, the amount becomes 90 too much, so that its 9th part is 10 too much.

Let the value of $,087314^{\frac{3}{11}}$ be required.

Log ,087314		= 8,941 0839
		× 3
	11	106,823 2517
Log ,514 286		= 9,711 2047

Again, for the value of $,00162344^{-\frac{2}{15}}$

Col ,00162344		= 2,789 5638
		× 2
	15	5,579 1276
Log 2,354734		0,371 9418

EXPONENTIAL PROBLEM.

The root and the power being both given we may have to find the index—that is, to solve the equation $r^i = p$, where i is the unknown quantity.

Here we have $i \log r = \log p$ and

$$i = \frac{\log p}{\log r}.$$

For example, the question may be asked, to what power must 17 be raised in order to give 58000?

Log 58 000	= 4,763 4280	log	= 0,677 9196
Log 17	= 1,230 4489	col	= 9,909 9364
Log 3,8713			0,587 8560

so that $17^{3,8713} = 58000$; or, in other words, 3,8713 is the logarithm of 58000 to the basis 17.

Or it may be asked, for how many years must £2793 be left at 3 per cent in order that it may grow to £57 893?

Log 57 893	= 4,762 6261		
Log 2 793	= 3,446 0709		
	1,316 5552	log	= 0,119 4391
Log 1,03	= 0,012 8372	col	= 1,891 5297
Log 102,5578 years			2,010 9688

MILLION TABLE OF NINE-PLACE LOGARITHMS.

NOTICE.

It is proposed to publish by Subscription a Table of Nine-Place Logarithms of all Numbers, from 100 000 to 1 000 000, in Three Volumes of Three Parts each.

PRICE ONE GUINEA per PART.

Subscriptions from Public Bodies and Scientific Societies will be received by the Author at No. 2 George Street, Edinburgh. Private persons are requested to subscribe through their Booksellers.

The finished calculations are in a state of great forwardness, and the publication will proceed as soon as Subscriptions are obtained sufficient to cover the outlay. The support of all interested in the advancement of exact science is earnestly requested for this undertaking.

WORKS BY THE SAME AUTHOR.

LIFE ASSURANCE AND ANNUITY TABLES.

FOUNDED ON THE CARLISLE BILLS AT 3 PER CENT.

VOL. I.—One life; contains the values of Whole Life, Short Period, and Deferred Annuities and Assurances for each year of age, and of Deferment, with their Logarithms.

VOL. II.—Two lives; contains Joint Annuities, Survivorships, Longest Life Annuities, Assurances and Reversions for every combination from year to year, with their Logarithms.

LONDON: CHARLES & EDWIN LAYTON.

A NEW GENERAL THEORY OF THE TEETH OF WHEELS.

In which the doctrine of Engrainage is treated in a new manner, and questions as to the numbers of teeth in contact at once, and as to the smallest possible number of teeth, are for the first time resolved.

EDINBURGH: THE AUTHOR.

ELEMENTARY ARITHMETIC.

Herein the principles are fully explained, all mnemonic rules avoided, and the compendious methods followed by expert computers carefully detailed.

EDINBURGH: WILLIAM BLACKWOOD & SONS.

HIGHER ARITHMETIC.

FORMING AN INTRODUCTION TO ALGEBRA ON THE PLAN OF EULER'S FIRST SECTION.

It contains the doctrine of Powers and Roots, with a simple and rapid method for extracting roots of all orders; and also an explanation of the construction and use of Logarithms.

EDINBURGH: WILLIAM BLACKWOOD & SONS.

COMPUTATION OF LIFE CONTINGENCIES.

WITH AN APPENDIX.

LONDON: CHARLES & EDWIN LAYTON.

TIME CONVERSION TABLES.

FOR

CONVERTING MEAN SOLAR INTO SIDEREAL, AND SIDEREAL INTO MEAN SOLAR TIME FOR EVERY TENTH SECOND DURING THE TWENTY-FOUR HOURS.

EDINBURGH: WILLIAM BLACKWOOD & SONS.
